Scoop the excess bubbles with a spoon and make sure there is no clumsy. Pour the mixture into a drying pan carefully and make sure it is spread out to dry. How long it takes, depending on the temperature and humidity in the room, and it can take several days (depending on your

recipe), you will not be able to remove the plastic from the drying sheet easily until it is completely dry, so be patient! If your first set is too sticky or thin, you can try again with a slightly less plasticizer. Remember that the above formula is just the beginning... Enjoy trying different proportions and combinations and making bioplastics from algae. You've shown that this isn't complicated. We can... Dear David, I am a small farmer who is suffering from the Depression and will not have the money to pay at this time. I believe your work in researching algae and your willingness to share with us may be the center of new global wealth for privilege. The greatest aspect of your job is empowering a small person, you're making us realize that we have other options. We will no longer enslave big energy companies. You've shown that this isn't complicated. We can do it, Larry D. Hayes, Oregon, USA.
